Summary

Mobile Application Developer with 4+ years of hands-on experience building Android, Flutter, and iOS applications for real-world enterprise use. Worked on apps used by thousands of field agents and end users across data collection, digital banking, and utility services. Comfortable with the full development cycle, from clean UI in Jetpack Compose, Flutter, or UIKit, to API integrations, local storage, and app delivery. On iOS, have built reusable SDKs using XCFrameworks and delivered responsive enterprise apps in Swift. A team player who enjoys writing clean code, solving practical problems, and continuously improving.

Work Experience

wAI Industries

Remote (Dubai Based)

Mobile Application Developer — Android | Flutter | iOS.

Dec 2024 – Present

- Designed and developed an **Android application** using Kotlin and Jetpack Compose (MVVM, Clean Architecture, Hilt) for field service operations, supporting 2,000+ field users with real-time job tracking and location-based navigation via Google Maps SDK.
- Built an **offline-first data sync system** using Room and WorkManager, ensuring the app remained fully functional under poor or no connectivity, with automatic background sync on reconnection.
- Integrated **TensorFlow Lite OCR** into the Android app to automate meter-reading capture directly from device camera, cutting manual data entry errors by 90%.
- Developed a **Flutter enterprise application** using Bloc for state management for a factory survey system, enabling field agents to fetch daily production tasks from the backend, submit structured data entry forms with production counts, and upload supporting images and PDF documents, with full API authentication, permissions handling, media upload, and step-by-step data submission flow.
- Built an **iOS Voice Assistant SDK** (Swift, UIKit, XCFrameworks) that plugged into host banking applications, enabling real-time voice-driven transactions through full-duplex audio streaming over WebSockets.
- Delivered **responsive iOS layouts** across all device sizes following enterprise UI standards.
- Strengthened app reliability across all platforms through code reviews, performance optimization, and Agile sprint collaboration.
- Applied mobile security best practices across all applications including secure API authentication, encrypted local storage, and protection of sensitive user and operational data.

ISSM

Islamabad, Pakistan

Android Developer (Promoted from Intern — Sep 2022)

Mar 2022 – Nov 2024

- Refactored legacy Android codebase into **MVVM Clean Architecture**, separating UI from business logic and enabling a more maintainable and testable codebase for critical banking features.
- Built a **contactless biometric authentication feature** for an enterprise banking app, allowing users to verify their identity through smartphone camera with 99% acceptance accuracy.
- Designed a custom **real-time camera pipeline** using CameraX, processing live frames and feeding them into on-device TFLite models with under 200ms response time.
- Developed a **voice assistant feature** for a fintech banking app, allowing users to complete transactions using simple voice commands, reducing multi-step flows to 2-step voice interactions and improving task completion speed by 60%.
- Built a **real-time audio streaming module** using WebSockets with on-device voice activity detection, handling end-of-speech detection and user interruptions with under 100ms latency.

- Collaborated with product owners and QA in **Agile/Scrum** sprints, contributing to planning, estimation, code reviews, and regression testing.
- Optimized battery consumption during continuous AI inference sessions, achieving approximately **40% reduction in battery drain** through efficient thread and model lifecycle management.
- Ensured secure handling of sensitive financial data throughout development, applying encryption, secure token management, and industry-standard mobile security guidelines.

Skills & Technologies

Mobile Development: Kotlin, Java, Jetpack Compose, Android SDK, Flutter, Dart, Swift, UIKit, XCFrameworks, Bloc (State Management)

Architecture & Patterns: Clean Architecture, MVVM, Hilt/Dagger, Dependency Injection

Networking & APIs: REST APIs, WebSockets, Retrofit, API Authentication, Media Upload

Local Storage & Sync: Room (SQLite), WorkManager, Offline-First Architecture

AI & Camera: TensorFlow Lite, CameraX, OCR, On-Device Inference, Voice Activity Detection

Performance & Tools: Kotlin Coroutines & Flow, ProGuard/R8, Memory Optimization

Maps & Location: Google Maps SDK, Location Tracking, Job Routing, Geofencing

Firebase: Cloud Messaging (FCM), Crashlytics

Security Awareness: Secure API Authentication, Encrypted Storage, Mobile Data Protection, OWASP Mobile Guidelines

DevOps & Workflow: Git, Gradle, GitHub Actions, Google Play, Agile/Scrum

Education

COMSATS University Islamabad

Islamabad, Pakistan

Bachelor of Science in Computer Science(Mobile Application Development)

Feb 2019 – Feb 2023

Project: LucaSeg – Mobile and web-based application for lung cancer detection using deep learning (CNN) models on CT-scan datasets with real-time segmentation and classification
